therapies in prostate cancer. Despite recent advances in the treatment of prostate cancer, patients with advanced disease still face a very poor prognosis. New hormone therapies for this disease are being developed. In addition to the development of medical treatments, new surgical approaches have also been developed. Surgical castration is a classic approach to this disease, but has been replaced by methods that aim to diminish the progression of the disease. A number of studies have shown that hormonotherapy alone can delay the progression of this disease, but that combination therapy is a more effective approach.

Riemann surface In mathematics, a Riemann surface, named after Bernhard Riemann, is a complex manifold which is the algebraic set-theoretic quotient of a complex manifold by a free discrete action of a group of automorphisms of the complex manifold. The Riemann surface is compact and connected if the group is a free discrete group of automorphisms (finite order). A compact Riemann surface has no more than finitely many points of the set-theoretic (complex analytic) topology, so in particular is a topological manifold. A Riemann surface comes with a conformal structure, and an integrable complex structure. Since the groups of automorphisms of a complex manifold form a complex Lie group, the action can be extended
